

THE SOLUTION TO THE FOX, THE GOOSE, AND THE BAG OF CORN

The farmer takes the goose across the river first.

He then returns to where he left the fox and the corn.

He takes the fox across the river next leaving the corn behind.

When he drops off the fox, **he takes the goose back across the river to where the corn is.**

He drops off the goose and takes the corn across the river to where the fox is. So now the fox and the corn are on one side of the river and the goose is on the other side.

Then the farmer returns to pick up the goose and crosses the river to where the fox and corn.

And so the farmer has gotten the fox, the goose, and the bag of corn safely across the river.

There is another way to get them safely across. Can you find that solution?
